

Rural banks face a technology adoption gap

A Rural banks are **crucial last-mile financial institutions**, serving remote & lower-income areas, supporting farmers, fisherfolk, micro-entrepreneurs, local savings & government financial programs.

B Rural banks face daunting **Tech challenges** ...

C ... that prevent them from taking advantage of the latest **Data Science and ML advancements**

Thin formal credit files can make otherwise viable rural borrowers difficult to assess

D Opportunity: use of lightweight, customizable data tools to extend evaluation beyond traditional financial records—**without replacing local credit judgment.**

Machine learning can help close the information gap

Non-traditional indicators

Digital money

Mobile money use, digital transfers, merchant payments

Payment habits

Utilities and recurring large-purchase payments

Mobile engagement

Phone access, mobile use and top-up patterns

Capacity & resilience

Income quintile, emergency-fund access, work search

Alternative credit scoring

- a) New indicators can surface financial behaviors not visible in bureau or bank histories.
- b) designed as a lightweight proof of concept that can be rapidly customized to a bank's data, processes and risk appetite.

APPROVED

DECLINED

Business value

Responsibly approve viable applicants missed by conventional rules.

identify risks hidden by sparse traditional data.

Approval uplift can translate into portfolio growth

APPROVED

DECLINED

₱737M

+ 10%
uplift

= ₱74Mn

Indicative average rural bank portfolio:
₱276.5B industry net loan portfolio ÷
~375 RCBs ≈ ₱737M per institution;
source: BSP/RBAP 2024 rural & coop. bank data

**Conservative uplift from alternative
credit scoring mechanism:**

- Machine learning may identify creditworthy applicants who fail conventional thresholds
- 15% to 47% historical increase with behavioral scoring *source: credolabs*

Indicative rural bank portfolio growth

BSP/RBAP industry totals are not a published median or typical individual-bank balance; per-bank figure is a rough sector-average proxy.

Better risk signals may reduce avoidable credit losses

APPROVED

DECLINED

₱737M

Indicative average rural bank portfolio:
 ₱276.5B industry net loan portfolio ÷
 ~375 RCBs ≈ ₱737M per institution;
source: BSP/RBAP 2024 rural & coop. bank data

- 2 ppts

Conservative reduction in past due & NPLs:

- Alternative features may reveal repayment capacity, financial behavior or stress signals conventional rules miss
- 10% to 15% historical RCB overdue or default rate; assume 2ppts reduction

= ₱16Mn

Indicative reduction in Past Due / NPLs

BSP reported a rural-bank-group past-due ratio of 11.31% in Jun-2026; past-due ratio is not the same as default rate.

Selecting a dataset for a prototype model

What is the Findex dataset?

- Global survey on financial inclusivity conducted by World Bank
- 144K total cases
- 9.7K records with loan application and approval data

Key limitations:

- Survey responses & approval flag—not verified repayment outcomes or default labels.
- Cross-country, self-reported data are not specific to Philippine rural-bank applicants.
- Feature availability, definitions and selection effects may not match bank operations.
- Findex has no direct rental-payment history; large-purchase regularity is only a proxy.

Lasso Logistic Regression model performs best and provides interpretable baseline & class-aware tuning

EDA + Feature Engineering	Model Selection	Model Tuning	Best Model
● 9,691 applicant records; ● 81 retained features ● Imputation ● Rare-value grouping ● Chi-square screening ● One-hot encoding	Models evaluated and metric (declined recall): ● L1 (Lasso) Logistic Regression: 0.692 ● CatBoost: 0.502 ● XGBoost: 0.482 NOTE: Recall of minority class treated as top metric for prediction of applications to decline;	● 3-fold CV with class-balanced weights ● Evaluated C grid 0.01–100; selected optimal C = 0.1	L1 (Lasso) Logistic Regression selected ● Precision 0.420 ● Recall 0.692 ● F1 Score 0.523 ● Accuracy 0.667 L1LR’s lower precision implies a conservative bias with more false declines, prioritizing risk mitigation

Audit shows most impactful characteristics—and an inclusion trade-off

Review of our model's feature importance...

TOP CONTRIBUTORS TO APPROVE/DECLINE DECISION*

- Prior mobile-money borrowing
- Prior formal-institution borrowing
- Previously received interest
- Searched for jobs online
- Top-quintile household income

** based on SHAP execution, L1 coefficient importance broadly aligned: prior borrowing dominated, with mobile access/use, job search, payment and income signals also prominent*

... reveal bias against unbanked individuals

MODEL LIMITATIONS

- Traditional credit-experience features can disadvantage unbanked applicants and reinforce prior access.
- Global survey relationships may not transfer to local rural-bank borrowers.
- Logistic regression assumes linear effects on log-odds; complex relationships may be missed.
- Approval labels can encode past lending policy, not repayment quality.

A model variant was trained using non-traditional features only . This reduced decline-recall from 0.692 to 0.586. This represents a financial inclusivity option, but, with a measurable performance trade-off

Move from global proof of concept to governed local pilot

1. Build a local outcome dataset

Link applications to repayment performance, delinquency, restructures and recoveries; define default consistently.

2. Co-design with loan officers

Map existing workflows, consent, data access, manual fallback and rural connectivity constraints.

3. Test features for coverage

Validate utility, mobile-money and digital-payment data availability; avoid penalizing people with no digital footprint.

4. Retrain & validate locally

Use time-based holdouts and out-of-time testing; compare baseline rules, logistic and tree models.

5. Govern decisions

Set human review, reason codes, override logs, privacy controls, security and model ownership.

6. Pilot safely & monitor

Shadow-score first; then controlled rollout with exposure caps, fairness metrics, drift and vintage tracking.

DECISION GATE: expand only when local repayment outcomes, fairness checks & operational controls meet bank-approved thresholds.
